F.H & C.E

The Hermit's peak and Calf canyon fire is currently the largest fire burning and the largest fire in New Mexico history, as of May 19th the containment is 34% and had burned 303,341 acres. Firefighters are trying their best to contain this megafire. This megafire is spreading fast so do whatever you can to prevent the fire from spreading faster.

F.S

If you or a relative needs to evacuate than this is for you, I recommend learning emergency skills like CPR or first aid. Ready:if in ready then gather supplies and know where you're going to go. Set: when in set you're going to need to get ready your home,and pack your items and have an escape plan.Go: evacuate your area. If in any of these three stages then stay connected with news of all fire reports.

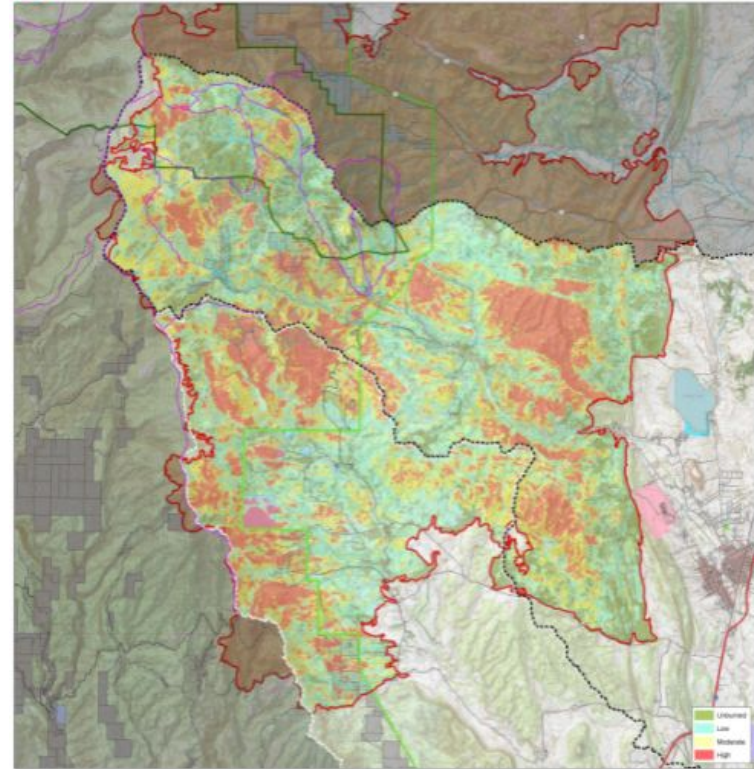

Soil Burn Map

A soil burn map is a map that shows how much soil has been burned. Red = Burned most to all of soil in area. Yellow = Burned some to most of soil in area. Green = Burned none to some of soil in area.
